

System 1 <> Review tagging

Review In <> Tag Out

Job of the system to classify the review and identify the issues

Review, Review ID, order ID, Rating, CustomerID, Partner ID, Location, Booking Time, Start Time, Category , location.

1. Positive / Negative
2. Target (Relevant or Not) -> Urban Company / Partner / Pricing / something
3. If Negative ->
 - a. Specific Problem Categories -> [List output]
 - i. Time / Partner Attitude / Skill Issue -> Categorisation
 - ii. Fallback of outside category
4. Customer Details
 - a. Customer Karma
 - b. Customer LTV / AoV [Mix across categories]
5. Severity -> 1 - 5 Scale

DB -> API Hit / Agent -> Output in DB [Real Time]

Decision -> Analyst to back fill data of Rating and No Review

Fallback of outside category -> Review by Human

Skill Issue -> Per SKU Detail of the Skill [Waxing -> Repair]

Partner Feedback -> Tie Back to This, % of Human Override, LLM As A Judge, Hidden Test

System 2 <> Aggregation

Non Agentic

SQL to roll from System 1 output DB

Partner x Category x Service x Location x Time

Part1 - Beauty - Waxing - Delhi - last 7 D -> rating 2, problems list,

Part1 - Beauty - Waxing - Delhi - last 30 D -> rating 3, problems

Part1 - Beauty - Skin - Delhi - last 7 D -> rating 5, problems

Part1 - Beauty - Skin - Delhi - last 30 D -> rating 5, problems

Benchmarking
